Application Tracker

Automation flow: from Huntr export to daily application counts

The Problem

Tracking daily job application activity required manually exporting data from Huntr and uploading it to ChatGPT. This repetitive process depended on remembering to complete each step.

Tools

Huntr	Windows Task Scheduler	Power Automate	Python	Google Drive API	ChatGPT scheduled tasks
Source data	Starts the flow	Downloads and extracts	Uploads the CSV	Stores the CSV	Logs daily counts

Workflow Triggers

Trigger	What happens
Data export	Windows Task Scheduler launches the Power Automate flow daily at 11 AM.
Application tracking	A scheduled ChatGPT task runs daily at 3 PM.

How It Works

1. Windows Task Scheduler launches the Power Automate flow.
2. Power Automate downloads the application data export from Huntr and extracts the CSV from the downloaded ZIP file.
3. Power Automate runs a Python script that uploads the CSV to a designated Google Drive folder using the Google Drive API.
4. At 3 PM, ChatGPT retrieves the most recently modified CSV through its Google Drive connection.
5. ChatGPT uses the CSV to log daily application counts in the Professional Achievement Project, checking for existing entries to avoid duplicates.

Impact

Automates recurring data retrieval, transfer, and application tracking, reducing manual effort and the risk of missed updates. Provides daily application counts to support progress monitoring against application goals.

Human Review

I periodically review daily counts and application trends in ChatGPT to assess progress and adjust my job search activity.
